Automate your warehouse processes

Reduce costs and increase reliability

Exact's barcode solution, Exact Warehouse Management System (E-WMS), automates the physical flow of goods and optimizes logistics processes for warehousing, wholesale and production companies. With E-WMS, warehouse transactions are instantly registered using barcode equipment. This reduces operational costs while guaranteeing better service thanks to delivery reliability and up-to-date stock information.

Speed up your warehousing

With E-WMS, warehouse transactions can be processed automatically by means of barcode scanning. Goods are picked in the warehouse using barcode scanners and the information is automatically sent back to Exact Globe Next to be processed. Data can be exchanged in real-time using radio frequency (RF) or in batches using batch registration. With the advantages of full integration with Exact Globe Next and optimized logistics, E-WMS speeds up your entire warehousing process, giving you a fast return on investment.

Eliminate paper pick lists

E-WMS eliminates the need for paper pick lists. Instead of being printed in Exact Globe Next, the lists are sent directly to a barcode scanner, which displays the pick orders based on warehouse locations. Scanning the barcodes of the items on the shelf also reduces errors. Whenever there are discrepancies between the number of items picked and the number of items in the order, the differences are automatically placed in back order in Exact Globe Next. You also have the flexibility to combine several orders in one.

Improve your customer service

With up-to-date insight into order status and fewer errors in your stock administration, you gain a highly accurate view of what is in stock at any given time. This not only allows you to reduce your stock levels, but improves your customer service and delivery reliability.
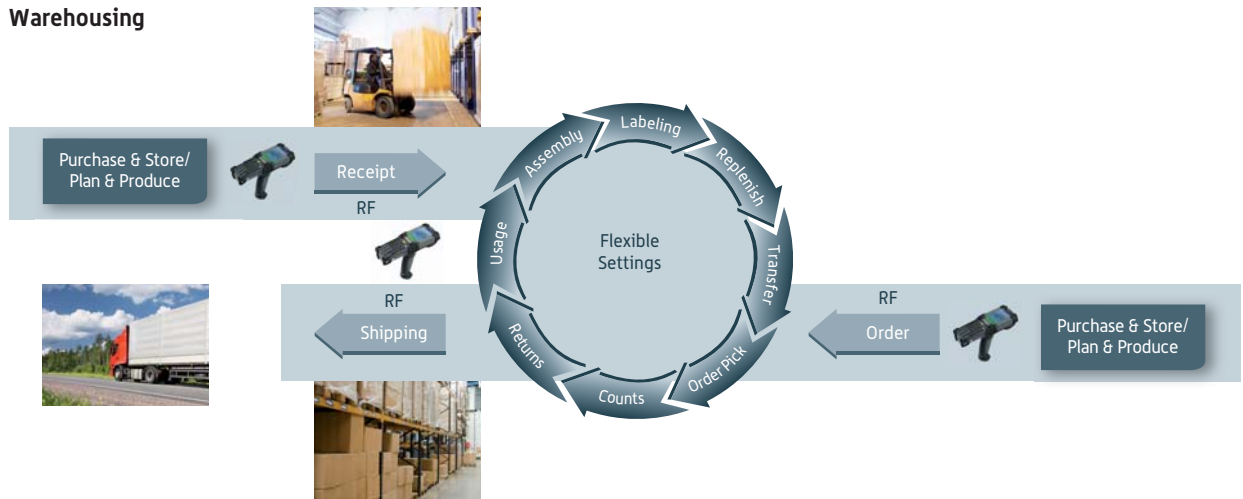

With E-WMS, you can:

1 Eliminate the need for paper pick lists
2 Automatically link received goods to purchase orders
3 Use radio frequency or batch communication
4 Maintain up-to-date and accurate stock information in Exact Globe Next
5 Easily register relocations
6 Take stock using barcode scanners
7 Use the route optimizing to generate picking advice
8 Register serial and batch numbers

And it all comes together.

Warehousing

Optimize your stock management

Effectively managing your stock is an important aspect of controlling business costs. Replenishment enables you to stock your warehouse in order to prevent delays in your sales order fulfillment processes. With route optimization you can generate picking advice for the ideal processing route, as well as serial and batch items based on the item's end date. Implementing Stock Keeping Units (SKU's) facilitates even higher efficiency and accuracy results in your warehouse. This ensures significant increases in the speed and quality of your order processing.

Choose from several licensing options

With E-WMS you can select one of several different licensing options, choosing the one that best fits the complexity of your assortment.

The benefits of E-WMS are:

- Fast return on investment
- Access to warehouse data from any location
- Reduced errors in logistics processes
- Speedy warehouse processing
- Elimination of manual processes
- Reduced stock levels

"Working with the E-WMS module saves an enormous amount of time. Previously we had to do everything manually, now we save about 80% of our time!"

Eddie Klooster, Facility Manager, LabNoord
